```
* 一个状态 s ,由所有 right 集合是 right(s) 的字符串组成。
* 这些字符串的长度范围是: [1[par[s]] + 1, 1[s]]。
* 状态的 right 集合是它 parent 树中所有孩子 right 集合的并集
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            if(ne[p][c] \&\& 1[ne[p][c]] == 1[p] + 1)  {
